

Self Reflection: Lab Report

I thoroughly enjoyed working on the lab report as a group assignment because it helped develop group work skills. It is more challenging creating a lab report with group members since you have to organize the most effective way to complete the assignment. This includes assigning a task to each member, completing your individual work on time and properly compiling your information into one paper. I think this forced me to develop collaborative skills and improve on the social aspect of the writing process. Whilst each individual had done their own research on finding articles and searched up 100 AI images, we had to collect this information and compile it into a concise, organized lab report.

I did enjoy the research process of this assignment and refreshing my skills on how to locate reliable, effective articles. I used various online library sources and databases to locate sources appropriate for the topic of the lab report. It was really interesting to read through the different kinds of sources each group member had collected to use for the lab report. I had previously written many lab reports so the format and the writing style used wasn't something new for me. I felt very comfortable in knowing how to organize and structure the paper. The workload of the lab report felt easier since there were multiple individuals working on the assignment.

My group members and I struggled a bit with how to cite our own data which we retrieved from Microsoft Bing. This was a type of citation that I believe all of us learnt about while completing the assignment. As a group we worked on drafting, revising and editing the report which provided unique perspectives on how each individual approaches each step of writing a paper. I think the lab report was beneficial in exercising my own writing skills and working with others to create a concise, well written paper.
